Final Year Project Assignment

Complete Answer - Final Submission

1.0 Project Introduction

Question: Describe the background of the proposed system.

Answer: FairPeer is a web-based system proposed to support the management of group assignments. It provides a structured platform for students to manage group work, submit assignment versions, record contributions and exchange peer feedback, while lecturers can monitor assignment progress and student participation.

1.1 Problem Statement

Question: State the main problem addressed by the system.

Answer: The main problem is the difficulty of managing group assignments transparently. Lecturers may have limited visibility of individual contributions, while students may face difficulties tracking progress, revisions and peer feedback.

1.2 Project Objectives

Question: State three objectives of the project.

Answer: 1. To provide an organized platform for managing group assignments.
2. To record and monitor individual student contributions.
3. To support peer review and assignment revision through structured feedback.

1.3 Project Scope

Question: Describe the scope of the proposed system.

Answer: The system covers student and lecturer users. Students can manage groups, tasks, contributions, assignment versions, peer reviews and final submissions. Lecturers can manage subjects and assignments, monitor student work and review group submissions.

2.0 System Analysis

Question: Identify the target users of the system.

Answer: The target users are students and lecturers. Students use the system to manage group assignment activities, while lecturers use it to create assignments and monitor student progress.

2.1 User Requirements

Question: State three user requirements.

Answer: 1. Students must be able to create or join a group.
2. Students must be able to upload assignment work and receive peer feedback.
3. Lecturers must be able to create assignments and monitor group progress.

2.2 System Requirements

Question: State three system requirements.

Answer: 1. The system must provide separate access for Student and Lecturer roles.
2. The system must store assignment, group, submission and feedback data in a database.
3. The system must allow uploaded assignment files and submission records to be managed.

2.3 Existing Problem

Question: Describe one limitation of the current method.

Answer: A limitation of the current method is that individual contributions in group assignments can be difficult to track, making it harder for lecturers to determine how much each member contributed.

3.0 System Development

Question: State the methodology used to develop the system.

Answer: The system was developed using the Agile methodology. Development was carried out through repeated stages of requirement gathering, system design, coding and testing, allowing improvements to be made throughout the development process.

3.1 System Features

Question: Describe three main features of the system.

Answer: 1. Assignment version management, allowing students to upload revised versions when revision is required.
2. Peer review and feedback, allowing students to review assigned peers and provide structured feedback.
3. Contribution monitoring, allowing group work and individual contributions to be recorded and viewed.

3.2 Testing

Question: State one testing method used for the system.

Answer: Functional testing was used to check whether system functions such as registration, login, assignment uploading, peer review and submission produced the expected results.

3.3 Future Work

Question: Suggest one future improvement for the system.

Answer: A future improvement is to develop FairPeer as a mobile application so that students and lecturers can access the system more conveniently using mobile devices.
